June 2021

## Foreword

**Euphoria has subsided in financial markets and renewed signs of inflationary pressures are challenging investors' assessment of the outlook. While we are positive over the medium term, volatility is rising and tougher times may lie ahead for risk assets.**

In this context, consumer confidence remains a bright spot in large economies, aided by vaccine rollouts and easing of restrictions. With incomes holding up well through the pandemic and bulging excess savings, we see opportunities in consumer discretionary and services providers as pent-up demand gradually comes through.

Equities seem to be at a tipping point after recovering from last March's pandemic lows. What happens next may depend on inflation. In this context, active management, diversification and investing in quality companies appeals. Further, exposure to private markets and options could help to hedge the risk of volatility spikes.

Similarly, in fixed income all eyes are on the recent jump in inflation and how the US Federal Reserve (Fed) responds to it. The Fed's patient approach may lead to more volatility. While we could see rates as high as 2% temporarily, a 1.6-1.7% range is more likely in our view. With the prospect of higher prices, inflation-linked bonds seem like an attractive long-term proposition.

After an 18% surge in the Bloomberg spot commodity index this year, talk of a potential commodity supercycle abounds. Base metals appear to be driving the resurgence in prices. Metals like copper and platinum are leading the charge, aided by their usage in renewable energies. The outlook for copper prices looks particularly favourable, whether this is a supercycle or not.

Finally, sustainable investing is as popular as ever. Inflows into sustainable European funds hit a record €120bn in the first quarter of the year, according to Moody's. If there is a fly in the ointment, it's a haphazard use of different terms, like ethical or sustainable. Consistent usage and a focus on helping investors to find opportunities in terms of financial and sustainability outcomes seems a sensible approach.

## Can consumers drive the post-COVID recovery?

Positioning portfolios for the post-pandemic economic recovery seems vital. Growth prospects appear encouraging. Starved of spending opportunities, consumers look set to hit the high street. But sectors likely to prosper may not be those that have suffered most.

The global economy suffered its worst performance since the Great Depression last year. A slump in household demand was a key element of the contraction as lockdown restrictions were implemented. However, there are increasing hopes that the reopening of economies and unleashing of pent-up demand will generate a powerful consumer-led recovery.

### Steady personal incomes and cash hoarding

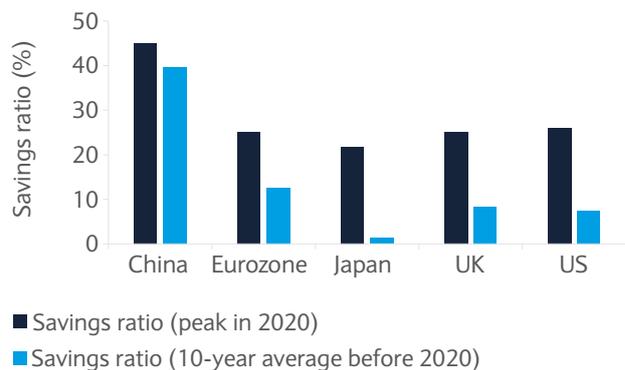

Despite the dramatic fall in output last year, personal incomes have remained relatively steady during the COVID-19 pandemic. Household balance sheets were stabilised by government job retention schemes, extended unemployment benefits and stimulus cheques.

Personal incomes in the US surged 21% in March, month on month (m/m), reflecting the changes in government social benefits. Additionally, historically low interest rates allowed home owners to refinance their properties and reduce monthly payments.

Consumers in the world economy are estimated to have accumulated excess savings of nearly \$5.4tn according to credit rating agency Moody's data<sup>1</sup>.

There are three major reasons why the cash hoard has developed. Firstly, forced savings: the closing of non-essential retail, as well as travel and leisure options, stopped consumers' ability to spend their money even if they wanted to. Secondly, higher precautionary savings: nervous consumers have been concerned about rising unemployment so have been increasing their financial safety net. Thirdly, the fiscal transfer: the rise in household savings is the counterpart to government deficits.

**Figure 1: Savings ratio soars during the pandemic**  
The peak savings ratio in 2020 compared with its ten-year average for China, the eurozone, Japan, UK and US

### Excess savings: where's the money?

With an extra \$2.6tn (12% as a share of GDP) squirreled away in bank accounts, the US is estimated to account for the large portion of the excess savings. Concerns around the medical and economic outlook in Europe encouraged people to save their money at record rates last year (see figure 1). The European household saving rate surged to 25% between April and June last year. Indeed, savings ratios were much higher last year than their average in the ten years to December 2019 in many leading economies.

<sup>1</sup> Moody's, Hot start for high yield, 22 April 2021 <https://www.moodyanalytics.com/-/media/article/2021/weekly-market-outlook-hot-start-for-high-yield.pdf>

The accumulated savings are not spread evenly across income groups. Higher earning households have saved considerably more than less wealthy ones. This may infringe on growth prospects, as wealthier households' marginal propensity to consume tends to be considerably less than their poorer counterparts.

### Rising consumer confidence

Improving sentiment surrounding vaccination programmes, the reopening of the services sector and the flow of fiscal stimulus has been reflected in recent retail sales and consumer confidence data. US retail sales boomed in March, rising 10.7% m/m and remaining at the same elevated level in April. Similarly, the Conference Board's index of consumer confidence rose to a fresh one-year high in April.

UK consumers are also feeling more positive. The GfK UK consumer confidence index recently rose to its highest level since the UK economy went into lockdown in March 2020. Eurozone retail sales registered an impressive rise in March too, up 2.7% m/m, equating to a 12% annual increase.

### Risks to the consumer recovery

There are still reasons why households may hold their money for a while longer. More cautious households might use the money to pay down debt or increase their safety net until the pandemic finishes or labour market conditions improve.

If coronavirus variants reduce vaccine efficacy rates and the recovery starts to stall, then consumer confidence could quickly deteriorate again.

The labour market recovery is key to consumption growth. As such, the return to work rate will be closely monitored by economists as governments withdraw furlough programmes. Rising price pressures could also reduce real disposable incomes and raise fears of an earlier hike in rates than expected.

### Encouraging growth prospects

Moody's estimates that the global figure for additional savings since the pandemic is more than 6% of gross domestic product<sup>2</sup>. If consumers were to spend a third of that, it would boost global output by two percentage points both this year and next.

The Bank of England has raised its 2021 growth forecast to a post-war high of 7.25%. This stronger growth profile is partly on the assumption that UK consumers will spend more of their £200bn of accumulated wealth than previously projected over the next year. Barclays Investment

Bank forecasts that private consumption in the US will grow 8.1% this year, helping to propel growth in the world's largest economy to above 7% in 2021.

We are of the view that the global vaccination programmes will help to arrest the virus, central bankers will look through any short-term spike in inflation and labour markets will recover (albeit at an uneven pace). Consequently, consumer confidence should continue to improve and support growth prospects.

### Sectors where consumers likely to spend

When trying to capitalise on the global consumers' war chest, investors may gravitate around the consumer discretionary sector. However, globally, this sector has already doubled from its pre-pandemic levels, raising questions as to where opportunities might lie.

With most households confined to home and so less likely to consume services, it is not surprising to see online retailers, home improvement stores and luxury companies being the main contributors to this outperformance. On the other hand, many companies exposed to the travel and leisure industry, including restaurants, have lagged significantly.

With economies reopening, international travel gradually resuming and consumers starting to spend more on services, these would appear to be well positioned to benefit. On the goods side, apparel will most likely enjoy the strongest rebound as consumers feel the need to buy clothes again.

### Focus on balance sheets, not price charts

For all the opportunities in the recovery, we don't think the market has missed something here. The fact that the shares of many travel-exposed companies remain well below their pre-pandemic level is, in part, justified in our opinion. Indeed, many had to raise capital, either equity or debt, to survive over the past twelve months.

As a result, while revenues and profits for travel-exposed companies may recover relatively quickly, the shift in their capital structure justifies lower valuations. In this context, we believe investors need to proceed with caution and avoid bottom fishing.

In consumer discretionary, services providers with solid balance sheets look preferable. Alternatively, investors should consider payments companies, as they stand to benefit irrespective of where the money is spent. Finally, in case consumers decide not to spend but to invest, asset managers could profit.

## Positioning for more volatile equity markets

With economic warning signs flashing and inflationary pressures building, volatility may spike. Equities appear to face a tougher few months too. Investing in private markets, to improve diversification, and volatility-related options may be part of the answer.

We suggested that investors should reduce cyclical exposure in portfolios as the pace of the recovery was likely to slow in May's Market Perspectives. Since then, volatility has picked up, global equity markets have been range-bound and the macroeconomic data have deteriorated versus elevated expectations.

We expect more of the same during the next few months and see benefits in thinking differently than usual when constructing portfolios.

### More challenging period as warning signs flash

As expected, while the macroeconomic picture remains encouraging in absolute terms, recent data have failed to match expectations, especially in the US. Worse, some parts of the global economy are flashing warning signs as inflationary pressures build faster than expected (see figure 1).

Furthermore, the shine has started to come off of previously very popular and speculative assets such as cryptocurrencies and special purpose acquisition companies. As the widespread euphoria dissipates, the next few months may prove more challenging.

### Focus on inflation

Equities find themselves at a tipping point following their rally from the pandemic lows seen last March. What happens next will likely be decided by inflation and whether, as the US Federal Reserve expects, the recent jump in consumer prices will be "transitory".

While there is debate about what transitory really means, economies seem unlikely to enter a period of sustained and higher inflation fueled by a sharp increase in wages (see What next for inflation as the Fed holds steady?, p8).

As such, we remain broadly constructive on equities, especially versus bonds. That said, volatility should remain elevated as central banks are likely to remain patient before committing to their next move.

### Figure 1: Less positive economic surprises

The trend in the Citi Economic Surprises Index since 2018. A reading above 50 suggests that economic data have been beating consensus, one below 50 suggests the data has been below consensus

Source: Citi, Bloomberg, Barclays Private Bank. May 2021

### Ignore the rotation, focus on quality

Many commentators remain fixated on the "value versus growth" debate and if investors should own one or the other. As we have mentioned previously, we don't believe in this debate. Year-to-date, global value – as illustrated by the MSCI World Value index – has outperformed its growth counterpart by 11%. However most of this outperformance materialised in the three weeks between 15 February and 8 March.

Since then the performance differential between value and growth has not been too significant. This shows how difficult it can be to capture these moves. In addition, on a 10-year basis, growth is still outperforming value by 130%. As such, for long-term investors, sticking with companies offering superior growth appears a more rewarding strategy. Our stance remains unchanged with a strong preference for quality over any other factor.

### Positioning for volatility ahead

In the current context, relying on high-conviction active management seems appropriate to navigate what is likely to be an uncertain summer. In addition, with volatility having jumped recently, now seems a good time to revisit portfolio construction and think “outside the box” to improve the risk/reward profile of equity exposure.

In practice, investors might consider three different approaches: improved diversification, increased exposure to private markets and using options.

### Improving diversification

With bonds providing little cushion during inflation-driven risk-off moves, the typical 60/40 portfolio is being challenged. Adding uncorrelated assets can help to diversify portfolios further and aim to reduce downside capture.

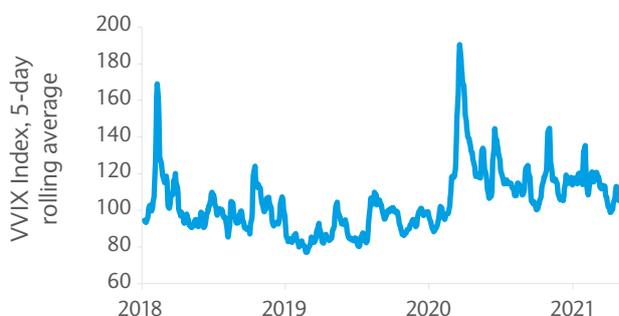

In looking for appropriate uncorrelated assets, certain alternative strategies with limited directional exposure may help. Similarly, maintaining a balanced geographical and sectorial exposure can provide added diversification benefits. Here we reiterate our view around a barbell approach between US and Asian equities together with a focus on healthcare, technology and part of the industrials and consumer discretionary complexes.

### Going private

Similarly, when possible, increasing exposure to private markets can help dampen portfolio’s volatility by removing the need for immediate mark to market. Additionally, with a much larger opportunity set compared to public equities, private markets can help investors fine-tune their exposure and capitalise on otherwise unavailable opportunities. As a result, it’s unsurprising to see that, private assets have tended to contribute positively to overall returns in the long run.

### Figure 2: Volatility picking up of late

Source: Bloomberg, Barclays Private Bank, May 2021

Note: The VVIX is a volatility of volatility measure in that it represents the expected volatility of the day forward price of the CBOE

### Making volatility your friend

While volatility is often feared, we believe that investors should embrace it and look for ways to profit from it. With higher volatility comes investment opportunities, whether in the form of better entry points in high quality stocks or more attractive payouts in options market.

Indeed, as uncertainty abounds and implied volatility increases (see figure 2), so does the value of certain options, all else being equal. This makes it a great time for investors to sell this volatility for a higher premium. Such additional performance can be used to boost portfolio returns or finance protection against a large pull-back in equities.

## What next for inflation as the Fed holds steady?

Financial markets seem gripped by inflation risk. Default and downgrade risk remain in the early stages of the recovery though the risk seems to have declined. However, rate volatility appears the dominant factor ahead and the Fed's "holding the line" patient approach may lead to more of it.

### Inflation print just tip of the iceberg?

The big bond market puzzle is around the question of whether the recent surge in US inflation, and elsewhere, is transitory or just the beginning of a higher inflation era.

April's US inflation jumped the most since 1981 on a month-on-month comparison (0.92%) and the most since 2008 on an annual basis (4.2%). This was also the biggest overshoot compared to consensus since 1996 (see figure 1). And for the first time since records began, according to Bloomberg, the print was above the highest consensus estimate. It seems that even the most bearish economists have underestimated the inflationary forces in play.

What a high number does not tell, is whether the surge in inflation is transitory or if the acceleration is part of a secular trend change. Given the importance of inflation expectations to the bond market, a closer look at the drivers of it seems justified.

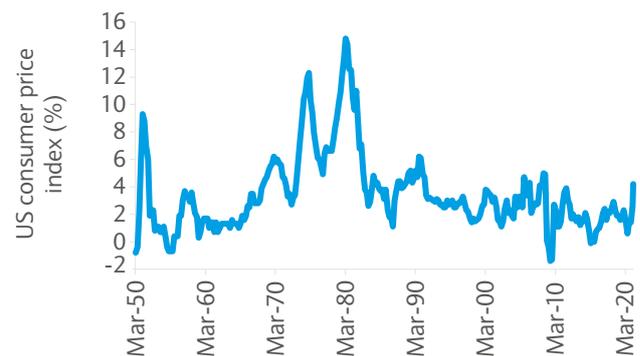

### The six main inflation drivers

The April inflation surge was largely driven by a sharp rise in household energy prices, airline fares, lodging from home and the prices for used cars. Various forces appear to have affected the print. Therefore, categorising the inflationary drivers seems warranted to make a better judgement. The following list is by no means exhaustive, and most driver categories are likely to be connected in some way:

1. Base effects
2. Pent-up demand and bottlenecks
3. Business cycle
4. Fiscal and monetary situation
5. Structural changes
6. Environment-related costs

Figure 1: US inflation shoots up in 2021

The trend in US the consumer price index, year on year, since 1950

Sources: Bloomberg

The hike in the energy price component can be easily explained by base effects given the depressed prices witnessed a year ago. These base effects are also likely to be dominant in the next readings and will likely occur in other parts of the economy pushing inflation further up.

The increase in airline fares and lodging from home can be associated with the pent-up demand which is also likely to be a dominant factor in the next quarters as economies are opening up gradually. In the case of airlines, fares would still need to increase by almost 20% before catching up to pre-crisis levels while lodging from home is still another 8% away from its pre-crisis levels.

Pent-up demand is likely to be supported by excess savings of around \$2.6tn in the US<sup>1</sup> and given that around 20% of that cash could be spent in the economy, helping to power the recovery.

<sup>1</sup> Moody's, Hot start for high yield, 22 April 2021 <https://www.moodyanalytics.com/-/media/article/2021/weekly-market-outlook-hot-start-for-high-yield.pdf>

### Bottlenecks everywhere

Higher demand is meeting supply constraints and the increase in used car prices is a perfect example of that imbalance. Inventories for motor vehicles and parts fell by 16%, according to the Bureau of Economic Analysis. This was exacerbated by the shortage of chips. This shortage directed demand to used vehicles.

Companies have pointed to supply constraints in most industries and it is likely to be a main driver of inflation in the coming quarters. The constraints may also be witnessed in the labour market in coming quarters. Given the US government's relatively generous fiscal aid packages, transition back to employment might be slow, putting pressure on wages (see figure 2).

Backwardation in the commodity markets, whereby spot prices are higher than future prices, is also a proof of the supply bottlenecks at the moment.

### Transitory versus persistent

Most of the described inflation factors can be classified as transient in nature as demand should moderate and supply may adjust relatively quickly. Such a rebalancing usually pulls inflation down in the subsequent periods of higher prices, one of the main reasons why most economists and central banks believe inflation towards 2023 will moderate again. Consensus shows the US consumer price index coming back under 3% by the first quarter of next year and averaging 2.3% in 2022, which seems realistic.

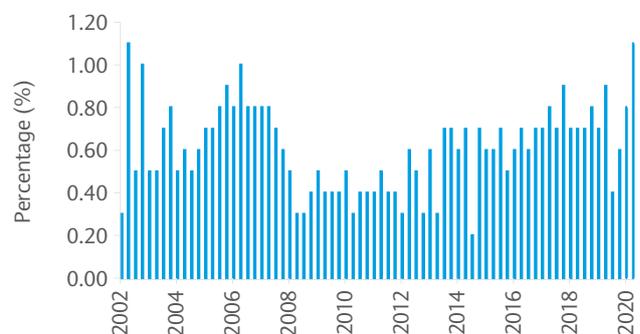

In fact, US Fed Vice Chair Richard Clarida reinforced the message in May: "One-time increases in prices are likely to have only transitory effects on underlying inflation, and I expect inflation to return to – or perhaps run somewhat above – our 2% longer-run goal in 2022 and 2023."

There is a risk that that even a temporary period of higher inflation could be amplified by a stronger than anticipated business cycle, the third factor as mentioned earlier. A stronger recovery beyond the catch up to pre-crisis levels has the potential to support consumer demand and economic output building up additional inflationary pressure.

The fiscal package signed off by the Biden administration of over \$4tn ("build back better") is likely to lead to such additional demand. However, most economic and inflation forecasts have already encountered the additional infrastructure stimulus while the stimulus may not be as

**Figure 2: Accelerating US wage inflation of late**

The quarter-on-quarter change in US private sector wage inflation since 2002

Source: Bloomberg

inflationary given it is spread over several years. Business cycle-related inflationary pressure, as described, would be likely detected in the labour market as well as in shelter price level trends.

### Are the 1970s back?

These risks are often highlighted by the so-called "inflationistas" who think that we are entering an era of structurally higher inflation. Some economists, like Larry Summers, have pointed out the combination of excessive monetary growth and high fiscal deficits which is reminiscent of the 1970s, when inflation jumped to over 14%.

As we've previously written, the correlation between a large level of debt, high monetary growth, inflation and higher rates was not obvious in the past and even negative at times. It is also important to stress that the record fiscal deficit is likely to fall again towards 5% by 2023 which would reduce the pressure for rate rises over time.

What is clear though is that apart from the fiscal deficit (Vietnam War, great society programme) monetary policy errors were committed back in the 1970s, which even the Fed acknowledged. First, the central bank did not challenge strongly enough the then prevailing "even-keel policy" which prohibited rate hikes during treasury debt issuance. Second, the Fed and most economists failed to recognise the Philips curve – the trade-off between unemployment and inflation – had broken down, as higher inflation did not lead to higher employment in the end.

### Too early to conclude the long-term outlook

Structural changes such as new global supply chains and technological advancements are likely to have an impact on inflation, but it seems less obvious whether these factors are going to be inflationary or disinflationary over the longer term.

In addition, the planned energy transition and increased focus on environmental sustainability may increase inflationary pressures over the long term. But new technologies and processes may equally lead to more efficient production processes which may ultimately put a cap on inflation. We would therefore be cautious to conclude that structural changes and a stronger environmental focus will lead to an excessive inflationary environment.

In conclusion it seems likely that inflation will increase substantially over the coming months due to the transitory effects as described. In addition, there is a risk that cyclical factors may add to the inflationary trend. However, it seems impossible to predict where inflation will be in the long run and if the current environment will lead to a trend change of the disinflationary environment witnessed over the past decades.

### Fed is “holding the line”

What can be expected from the central bank and policy rates in this context? In the past, market participants have been sensitised to higher policy rates leading to higher rates along the yield curve. This time the concern is that the Fed is pursuing the strategy of “holding the line” (like in the movie *Gladiator*) for too long with low rates providing the feeding ground for excessive inflation subsequently.

The Fed defends its positioning by reiterating that inflation and dynamics are well understood today, contrary to the 1970s. Apart from the higher tolerance for inflation, the Fed seems to have a strong focus on the labour market.

In hindsight, the Fed may have accepted that the last hiking cycle was too sharp and quick for the labour market (despite low unemployment rates) given the existing “slack”. With this in mind, the central bank will likely hold the line longer than for most market participants liking.

The Fed’s envisaged policy rate path, shown in its latest dot plot estimates, does not include a hike in 2023. There is a strong likelihood that with higher inflation, the dot plot for 2023 may show a first rate hike in the coming months given that only two additional voting members would need to envisage a hike. This is unlikely to spur the bond market as the market already implies a first move by March 2023.

### Further rate volatility likely

Rates could, however, face renewed volatility as we approach the start of the tapering of the existing bond-buying programme.

The Fed might become more vocal in August/September with first action as early as March/April 2022 and by the latest when the Fed has evidence of “substantial progress” in the labour market. While volatility could lift rates as high as 2% temporarily, a range of 1.6%-1.75% seems more likely in our view.

Michel Vernier, CFA, London UK, Head of Fixed Income Strategy

## Are inflation-linked bonds the ideal hedge?

With US inflation rising and investors increasingly focusing on inflation risk, investing in inflation-linked bonds appears to be one solution to hedging against higher, persistent inflation.

### Inflation-linked bonds in focus

Recently, higher rates have been driven by stronger trending breakeven yields (market-implied inflation). In earlier publications we noted that breakeven rates seem highly correlated with investor sentiment rather than actual inflation.

With the 10-year breakeven inflation rate now at the highest level since 2013, the question is whether the level will be matched by real inflation over the longer term and if inflation-linked bonds are still a good hedge against rising inflation.

### Tourists investors have discovered inflation linked bonds

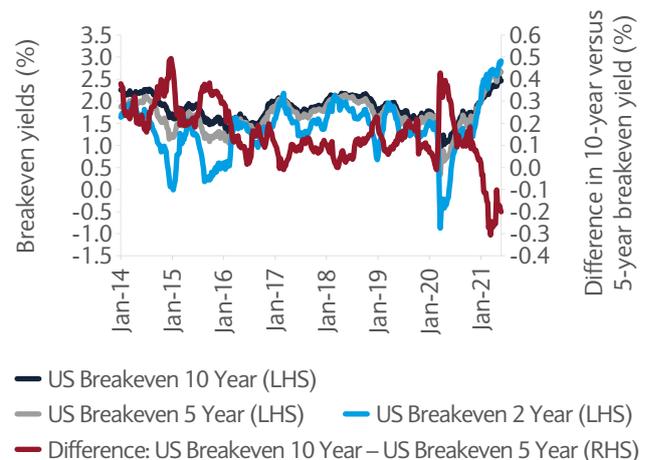

Demand for inflation-linked bonds is typically found from pension funds and asset managers and is generally quite sticky. That said, recent inflows, as indicated by exchange-traded flows, into inflation-linked bonds were also driven by retail and tactical investor demand.

This extra demand has come at a time when the Fed has increased their holdings, now owning around a quarter of US inflation-linked bonds from 10% at the end of 2019. Another sign that the inflation trade, at least in the short term, seems crowded is the fact that inflation swaps volumes have increased by 40% (commonly used among tactical hedge fund investors) compared to pre-crisis levels.

A closer look reveals that even investors seem to be placing more weight on the transitory nature of inflation. While in the past breakeven yields of longer tenors, like 10-year bonds, were trading above the shorter tenors, this year the breakeven yield curve has been inverted (see figure 1). The 2-year breakeven trades roughly 30 basis points (bp) higher than the 10-year breakeven rate, implying that inflation is likely to moderate again. The potential to earn “fast” money by investing in short tenors seems limited.

Figure 1: Breakeven rates inverted

US breakeven yields for 2-year, 5-year and 10-year bonds since 2014

Sources: Bloomberg

### Focus on 2.5% inflation threshold

Over the last 20 years breakeven yields seem to have overpriced realised inflation in the following years (see figure 2, p12).

Admittedly realised inflation trended lower in the respective period. If a period of inflation persists of above the central bank target of 2%, 10-year inflation-linked bonds are likely to outperform their nominal counterparts. This is illustrated in the past performance of inflation-linked bonds plotted against nominal government bonds in different periods of inflation over the last 20 years.

### An attractive proposition

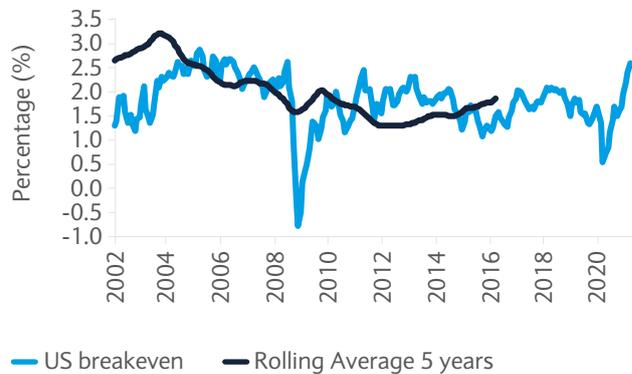

In periods of above-target inflation, some of the investment rationale for inflation-linked bonds lies on their performance against nominal treasuries (see figure 3). The grey-shaded area shows US inflation deducted by 2%, given this was and is until now the average Fed inflation target. Only in periods when inflation averaged persistently well over 2% have inflation-linked bonds outperformed nominal sovereign bonds.

While inflation has only recently started to increase and while it is still not clear whether inflation will stay at around 2.5% or higher for long, inflation-linked bonds are already anticipating such a move. This suggests that inflation-linked bonds are generally rich in pricing.

However, in the longer term, the performance of inflation-linked bonds at least matches sovereign bonds and with the additional potential of “known unknowns” inflation linkers might warrant consideration.

## Is it time to use leverage in bond investing?

As bond investors look for ways to optimise returns for acceptable levels of risk at a time of low rates, leveraged bond investing may be one way to achieve this.

Investing in bonds is increasingly challenging as a result of record low yields in most bond segments (see figure 1). In seeking to improve yields, investors may be tempted to compromise on the quality of their bond investments. This carries extra portfolio risks.

### Best of both worlds

By using securities lending, higher returns can potentially be achieved without compromising on the credit quality. In addition, securitised lending can provide more portfolio flexibility in managing liquidity, potentially useful at times of heightened volatility and in order to avoid selling investments at distressed prices.

At the same time, additional lending increases loss potential given the leveraged exposure. An understanding of how lending can help and what risks are involved is paramount.

Leverage in this context describes using additional borrowing in order to fund part of the investment portfolio. This results in “leveraged” exposure to the investment portfolio given not only is an investor’s own capital used but also additional borrowed capital, which comes at a cost. Given the leveraged exposure, the loss (risk) and return potential are greater compared to an unlevered portfolio using only own funds. The following sections explain the basics when using borrowing when investing in fixed income portfolios.

### Leveraged bond investing: main considerations

Many factors come into play when combining additional borrowing with bond investments. The key elements include the borrowing allowance which is dependent on the lending value percentage of the bonds serving as collateral. This percentage in turn is determined by the quality and level of liquidity.

Meanwhile, the level of the borrowing cost depends on market rates and the composition of the collateral portfolio.

In this context, rising borrowing costs could have the effect that leveraged returns can decline or even become negative.

**Figure 1: The slide in bond yields**

Trend in Barclays US aggregate bond index investment grade yields since 1991

Source: Bloomberg

It also seems important to consider the leveraged exposure which can lead to leveraged profits but also to higher loss potential compared to non-levered portfolios.

### Portfolio effect

Using leverage does not change the approach of investing as return and risk should always be considered. By using leverage, and by considering the important additional risk factors, portfolio return and flexibility can potentially be increased, helping investors to target their long-term goals despite persisting low rates.

You can find out more about how leveraged investing might help you in our next education series, to be published later in June. The series looks at the basics of the approach and its potential effects on portfolio dynamics while examining the most important factors to consider when using additional borrowing.

## Private markets: the ultimate frontier?

As we enter the post-pandemic era for investors, the traditional portfolio of equities and bonds could face some key challenges. For those focused on obtaining longer term returns, could private markets provide a solution?

Continuing to invest in a traditional 60% equities and 40% bonds split may face significant challenges over the next five years. The reasons for this appear to be a combination of strong expectations around the economic recovery, record fiscal stimulus, amid bloated government debt levels, historically low interest rates and the risk of higher inflation.

Historically low yields and rising inflation weigh on expected returns for developed market bonds via two channels – weak income return prospects and limited capital appreciation potential. While accommodative monetary policy should continue to support equity returns, returns will likely face pressure due to uncertainty, peaking economic momentum and expensive valuations.

Thus, the next five-year investment horizon will likely entail lower returns on main asset classes than history suggest.

### Stabilising portfolios and fighting inflation

May's Market Perspectives showed that during periods of higher inflation, the correlation between equities and fixed income becomes positive which means from a diversification standpoint, the traditional portfolio could fall short.

Building a well-diversified portfolio can substantially reduce risks and enhance risk-adjusted returns. Therefore, it could be time for investors to rethink their optimal asset allocation policies to address the issue of lower returns and higher uncertainty. The most efficient and flexible way to improve on traditional 60/40 portfolios is to consider inclusion of other asset classes.

In April's Market Perspectives, we showed how the adding of hedge funds to a portfolio could not only protect portfolios during down markets but could add to performance during up markets.

In the May edition, we noted how the inclusion of real assets such as commodities, real estate and infrastructure can provide an inherent hedge against inflation, while

also enhancing risk-adjusted performance during inflationary periods.

### Reaching the ultimate frontier with private markets

However, for investors who are able and willing to tolerate some illiquidity in their portfolios, private markets can boost returns and improve diversification.

From December 2007 until September 2020, private equity (PE) posted average return of 10.7% per annum (see table, p15). This was the highest return of all considered asset classes. It was ranked among the three best performing asset classes in 10 out of 13 years in the sample. A negative return was recorded only in 2008. In other years, the return on PE varied between 8.0% and 19.6%.

Other private markets also performed well. For example, private debt and infrastructure were in the negative territory only in 2008 and 2009, respectively. As a comparison, listed global equities posted negative returns four times (2008, 2011, 2015 and 2018). The average performance of private debt and infrastructure was similar to that of high yield bonds and listed global equities.

Taking a closer look at 2018, the year when apparently "cash was the king", some liquid markets did lose money. However, all private markets actually displayed positive excess returns.

### Differentiating between risk regimes

An average performance provides valuable information and paints the big picture. However, the resolution may not be sharp enough to differentiate between risk regimes.

When deciding on their strategic asset allocation mix, investors are likely to be particularly interested in asset classes which provide protection in down markets and offer attractive returns in up ones.

Asset class returns ranking (2008-2020)

2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	Average

Sources: Bloomberg, Preqin, Barclays Private Bank. Data accessed in May 2021, last observation point September 2020.

Figure 1 demonstrates that – since December 2007 – private equity, private debt and infrastructure performed positively over an investment horizon of five years. In fact, their worst five-year stretch (3.3-4.3%) compares favourably with public and other private markets. Historically, high yield bonds and listed global equities hold the pole position in terms of the best consecutive five-year performance (17.8-19.4%), closely followed by private equity and private debt (around 15.7%).

Breaking down private markets investing

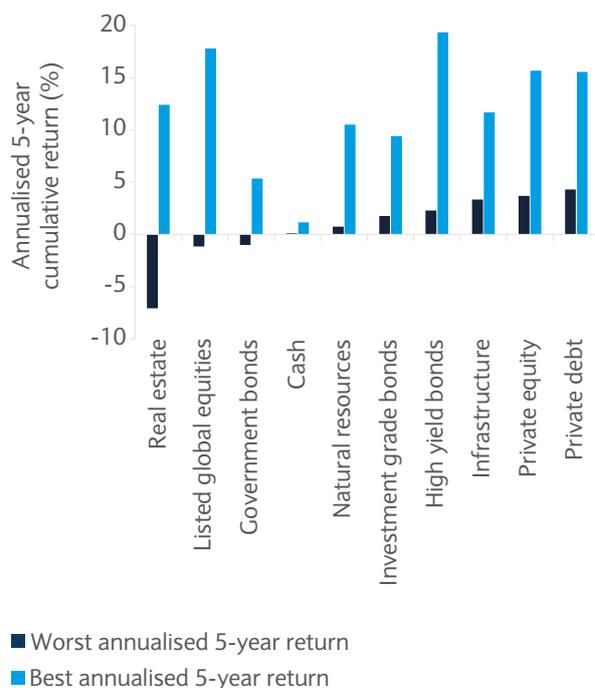

Private market investment represents ownership in privately held companies. Investors can tap into PE market through direct investments or indirectly via funds. The latter require commitments over a longer period of time – for instance, ten years – over which investors deploy capital and receive income and capital distributions.

Liquidity is the fundamental difference between public and private markets. Investing in private markets means investors face systematic illiquidity due to long capital lock-up periods. Historically, the liquidity premium is about 2% on average. Over longer periods of time, the compounding effect boosts the wealth accumulation process.

Figure 2 (see p16) shows the dynamics of the private market premium. Since December 2007, private equity, private debt and infrastructure added on average 4.3%, 1.2%, and 3.0%, respectively, on top of the selected public market benchmarks.

Figure 1: Unlocking return and diversification potential with private markets

The worst and the best annualised five-year returns for public and private markets from December 2007 until September 2020

Sources: Bloomberg, Preqin, Barclays Private Bank. Data accessed in May 2021, last observation point September 2020

### Growing asset class

During the past two decades, the growth in private markets has unsurprisingly been quite remarkable.

PE has earned the status of a stand-alone asset class. Active ownership, specific value creation and exposure to different businesses and factors relative to comparable public markets contribute to a unique investment profile and significant diversification benefits.

Despite a volatile fundraising year in 2020, as a result of the pandemic, assets under management (AUM) in private markets grew by 13.2% to a record \$8tn (see figure 3), a compound annual growth rate (CAGR) of 12.4% since 2000. PE has been the key driver, growing at a CAGR of 10.9% over the same period.

Given our view in the May's Market Perspectives of smart infrastructure leading returns in the next decade, its CAGR of 24.7% during the same period is worth noting.

### Harvesting PE's liquidity premium

We can see quite clearly the appeal private markets have. Over the longer term they provide higher returns, lower volatility and much more exposure to companies than public markets.

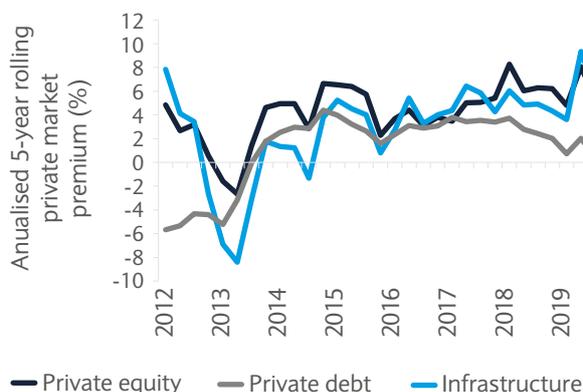

However, one cannot ignore that similar to hedge funds, each investment is very diverse and heterogeneous. High performance dispersion is the key to unlocking alpha generation potential. Skilled managers who have informational advantage and expertise in identifying entrepreneurial skill can significantly enhance returns through the selection process and active management.

The data supports the notion that private markets can diversify portfolios, enhance the risk-return profile and give investors exposure to niche companies. However, private markets are a long-term proposition. In particular, short termism and financial conservatism do not bode well with investments in PE.

Instead, investors with long-term aspirations and liabilities, possess the capacity to hold illiquid assets in their portfolios and can make significant capital commitments, seem best positioned to harvest PE's liquidity premium.

## Unpicking the jargon of sustainable investing

While frequently treated as interchangeable, not all approaches to sustainable investing are identical. As it continues to gather momentum in the investment industry, and investors look to benefit from it, we pause here to clarify this critical point.

After hitting all-time highs during 2020, Morningstar noted that inflows into sustainable European funds broke the quarterly record again in the first three months of this year, attracting €120bn. In addition, 111 new sustainable funds were launched<sup>1</sup>.

Unfortunately, most commentators, investors and marketers treat the underlying universe of investments as equivalent and unitary. The terms “ethical”, “sustainable”, “ESG”, “SRI” and the like continue to be used haphazardly when discussing the topic.

The EU Sustainable Finance Directive (SFDR) was intended to clarify the issue, reduce greenwashing and jargon. However, the initial reaction seems to have been to add three more descriptors – Article 6, Article 8 and Article 9 – to many writers’ bingo wheels.

### Labels, labels everywhere...

The problem of not having a consistent, common language is typical of a rapidly evolving industry in its adolescence. A lack of universally accepted terminology may be an issue; but the greater one is the lack of consistent usage, or lack of effort to be specific.

This is a known and lamented industry challenge. But, it has implications for investors wanting their capital to generate positive outcomes alongside financial returns. This makes it important to explain the differences between the terms and their usage so that investors can make the best selection for their investment and sustainability objectives.

### A sustainable thought exercise

To illustrate, let’s review a small selection of indices and associated exchange-traded funds (ETFs) that provide exposure to US equities relative to the S&P 500 and are intended to be “sustainable”. Importantly, the demonstration does not cover the full spectrum of

sustainable products. Here we’re just reviewing sustainable investments that use ESG based on their labels and their prospectuses.

A few caveats first for the associated table. While similar, they do have differences; but for ease, we can assume that if you want to invest sustainably into the US mid-to-large cap market, you might pick any one of them. Also, use of these indices or associated funds here is neither an investment recommendation, nor advocacy or criticism for the approach taken by the index provider or manager.

### You can’t judge a fund by its cover

First, let’s start simply with names (see table, p20). Between the (A) MSCI USA SRI ETF, (B) MSCI USA ESG Screened ETF or the (C) MSCI USA ESG Select ETF, which one would you pick as the hypothetical investor? All three would be SFDR Article 8 funds. If you wanted the “most” sustainable one, which would it be? What positive outcome(s) would investing in any of them generate? Which actual investment approaches do they use?

Obviously this won’t be immediately clear from names, but it’s slightly more complex. For example, let’s look at (B), which is “ESG Screened”. Does that mean it is screened on ESG criteria? Would that be an overall ESG rating, or across each E, S and G rating? Is that on a best-in-class for each industry or to a minimum level across all industries? Or perhaps the overall score? Or is it first screened on an ethical basis and then uses ESG?

Appreciating these naming challenges starts to demonstrate that simply labelling or saying an investment product uses ESG does not mean they are all identical. These may be easy criticisms, especially as there are limitations on fund names. But stepping back, when talking about the pros, or cons, of “ESG investing” it’s not immediately clear what that means.

### Looking beneath the label

Second, what would you expect the underlying holdings of these “sustainable” indices to be?

Upon review of top 10 holdings in the table, investors newer to the field may be surprised to find such well-known companies, even though that was the segment of the market we had specified. As well, these may not be the firms that immediately come to mind as solving societal issues such as climate change or healthcare (even though some do have business lines addressing these issues). Moreover, some investors may have strong personal views about how “sustainable” or “ethical” these companies are given their experience or what they see on the news.

But ESG is not primarily about making a moral judgement<sup>2</sup>. It’s about incorporating the environmental, social and governance risks relevant to the sector and company into investment selection. Primarily it’s a risk mitigation tool. So the selected US large or mid-cap companies are ones that, based on the underlying data providers and ratings, are better at managing the ESG risks, or higher performers against their peers<sup>3</sup>.

Ultimately, ESG consideration can be applied to any company. It’s helpful to think about it as a look into the internal operating practices of an organisation. The aim is to get insight into how well-run is the organisation. This is distinct from considering the implications of the organisation’s goods and services externally, where the positive and negative outcomes are also considered.

### Focusing too much on the label, not the practices

So even an illicit cocaine cartel could score well in some ESG criteria, hypothetically, if it had environmentally friendly growing practices, paid living wages and had streamlined and clear governance<sup>4</sup>.

As exaggerated as the above example is, it shows that investors shouldn’t think about investing in “ESG” as categorically generating societal benefits through their portfolio. As well, the reverse that simply because an organisation’s trying to “do good” through producing electric vehicles, addressing food waste, or providing education, does not mean this flows to the organisation’s operating practices.

Investors shouldn’t be surprised to find brand name companies in sustainable investing products where they prioritise ESG considerations. The primary aim is to find the well-run organisations, not necessarily the ones solving the most critical global problems.

This difference, and the rallying of most capital towards ESG, is why many of the field’s original advocates are understandably critical. There is a concern that simply by focusing on these ESG operating practices, and not actively putting capital towards solving our global problems, we may be generating a false sense of security or accomplishment.

### Only the first step

As this brief case illustrates even with a criteria of investing sustainably for US exposure primarily incorporating ESG considerations (though some had ethical screens as well) can yield very different results. The difference in holdings and weightings will then flow to a divergence in investment performance too.

Notably, all are passive investment products which tend to be the more transparent and detailed about their investment process. Index methodologies are generally available to review. Given time and knowledge, it is possible to decipher how sustainability appears in their investment process and the result in terms of holdings.

With active managers, that process tends to be more opaque as either ESG ratings and/or underlying data is incorporated into discussions and decision-making with varying specificity (as explained further in the second half of our Outlook 2021 article on Material E, S, G factors in 2021).

If we added other sustainable investing funds into the mix, this would diverge even further. For example, these could be sector focused, such as renewable energy, circular economy or healthcare. Or indices or funds where, along with assessing operating practices, they explicitly target companies whose goods and services seek to solve societal problems. When collecting all these different approaches together, it becomes clear that loosely referring to “ESG”, “ethical” or “sustainable” funds does not help the industry. Nor investors.

### Focus on the investors

While critical here, though primarily of commentators and marketing, the industry is making collective and considerable effort to address terminology issue.

Hopefully, highlighting these differences does not cause readers to throw up their hands up in disgust at the situation, but be more confident to ask for explanations – how does this investment incorporate sustainability? Where does it focus operating practices and/or goods and services? What techniques or approaches does it use? What are the implications?

These questions will help to diminish the risk of getting caught in potential bubbles and greenwashing. They will also help to avoid confusion that having a sustainable label is an indicator of quality, or competence of the underlying manager.

Finally, it’s important to note that the above illustration presents sustainable investing from a product perspective. In reality, it starts with investors’ financial and sustainability objectives, and only then navigates to investment opportunities. In this way, industry jargon is bypassed and the focus is on helping clients to generate financial returns and societal outcomes in the way that matters to them.

<sup>2</sup> It is possible for investors to use ESG data to make these personal judgments, however the dominant use is for risk management or alpha generation.

<sup>3</sup> Separately different data providers have different data and ratings systems, making it possible for companies to appear to have high ESG ratings in one index and low ones in another.

<sup>4</sup> Though overall ESG rating might suffer, owing at least to issues such as carbon footprint of its transport, employee health & safety practices, or tax payments.

Alexander Joshi, London UK, Behavioural Finance Specialist

## Learning to shut out market noise

Bias and noise can affect investors' decision-making, and market sentiment can overreact in the short term. Investment success rests on distilling market noise and focusing on what really matters, with diversification key to help investors with this.

In their latest book, *Noise: A flaw in human judgement*, Nobel laureate Daniel Kahneman and distinguished behavioural economists argue that society has rightly devoted much attention to the problem of bias – predictable errors that incline a person's judgment in a particular direction – but should also pay attention to another type of error: noise.

Consider your bathroom scale. If on average its readings are too high, the scale is biased. If it displays different readings when used several times in quick succession, the scale is noisy. While bias is the average of errors, noise is their variability. Investors may have observed that forecasts of economic outcomes can be notoriously noisy.

### What does this mean for investors?

The central tenet of financial markets is the efficient market hypothesis. It states that share prices reflect all information, and with stocks always trading at their fair value it would be impossible to consistently generate alpha and outperform the overall market.

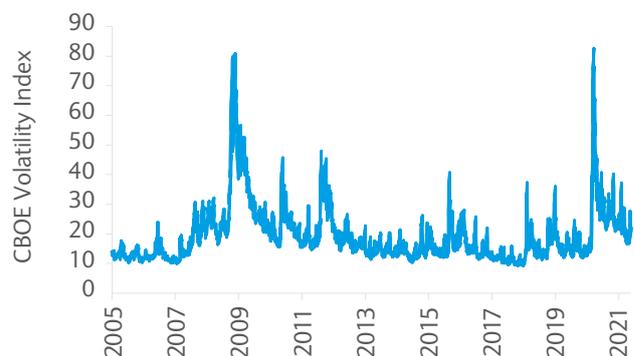

As professional investors we see that inefficiencies and therefore opportunities do exist, due to a range of reasons, including market psychology and human emotion. Market sentiment can become excessively optimistic or pessimistic, which can lead to market overreaction to events and news. This can steer investors off course, as well as provide them with opportunities.

### Challenging investing times

We are now entering a potentially challenging period for investors, with the potential for market turbulence. The recovery is underway, spurred by successful vaccination drives, pent-up savings and government support. However, the pandemic is far from over, with daily recorded cases globally still at very high levels and the risk of new variants a concern.

### Figure 1: Volatility can spike rapidly

The performance of the VIX since 2005. The VIX is an index representing the market's expectations for volatility over the coming 30 days

Sources: Bloomberg, Barclays Private Bank

Meanwhile, inflation data is prompting a rethink about asset valuations in parts of financial markets. It is imperative for investors to know what, and what not, to focus on.

### Distilling the noise

In a world of real time news reporting, there is no shortage of voices trying to grab the attention of investors. Ever shortening news cycles can induce short-term thinking in investors, which can threaten to derail long-term success.

With markets composed of many different individual agents, there is ample opportunity for noise. Successful investment performance, on a continued basis, rests on distilling the noise and focusing on the fundamentals which really matter. Much of the market commentary will not be material to a diversified investment portfolio.

Having a robust investment process and discipline when changes are made to investments, alongside a plan and rules for when changes are made, may be one way for investors to reduce bias and noise in their own decision-making. A robust process can also reduce the impact of external noise on decisions.

#### Beware of extreme moves

Being aware of the role of noise and aspects of investor psychology can help investors to not get swept up by market sentiment. Sentiment can become extremely bullish or bearish in the short term, and also swing from one end to the other extremely quickly. This is demonstrated by the speed at which the VIX, the widely used volatility index that gauges market sentiment and points to the degree of fear among market participants, can spike during times of market stress (see figure 1, see p20). This is mirrored by investor sentiment indicator data (see figure 2).

Equally striking is the speed at which these elevated levels can fall and how investor positioning closely mirrors sentiment indicators (see figure 3). The implication is that investors that get swept by excessively strong sentiment in a particular direction and act upon it may take actions that are not in their long-term interest; for example, selling during a bout of volatility and a short correction that very quickly fades away.

#### Investing doesn't have to be difficult, but it is complex

It is important to appreciate the speed and efficiency with which information is priced into markets and their forward-looking nature.

For investors attempting to make sense of events and the reaction of the market to them, reactions can appear to be counter-intuitive, like a pull-back on what appears to be positive news. Forward-looking market participants may be looking more at aspects such as the rate of change of a certain data series than the headline figures (the second derivative).

While investing does not have to be difficult, financial markets are complex. Unpicking the drivers of events and understanding causation can be challenging.

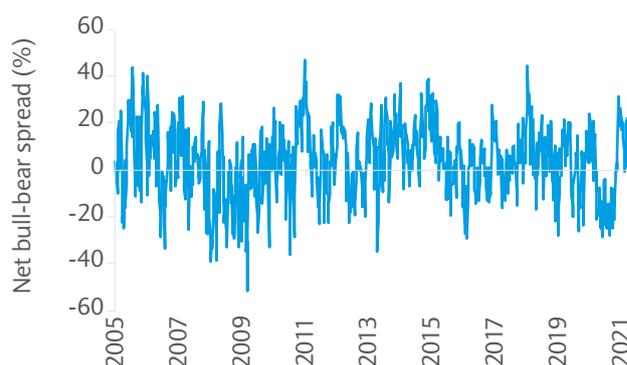

We believe that investors may receive the best returns by focusing on having in place the fundamental building blocks for long-term investment success – asset allocation, diversification and active management – than the minutiae of short-term movements. A professional investment adviser can support the investor by making sense of them.

#### Diversification offers protection

So what can an investor do to protect themselves from the so-called “animal spirits” of markets? The first thing to keep in mind during times of stress (or excessive exuberance) is that the market isn't one single entity that moves as one. Financial markets are composed of many moving parts.

#### Figure 2: US investor sentiment can swing wildly

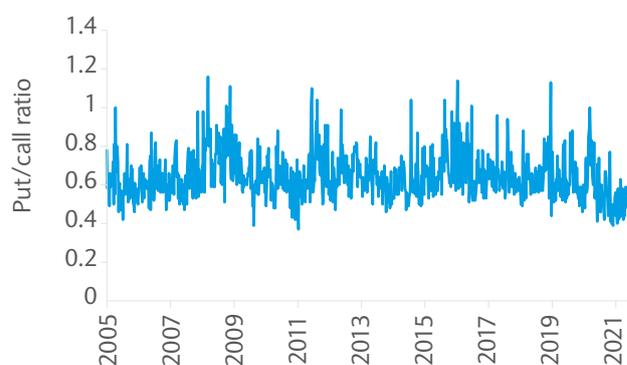

The trend in the net bull-bear spread since 2005, showing whether bullish investors (a positive reading) or bearish investors (a negative reading) are in charge

Source: Bloomberg, Barclays Private Bank

#### Figure 3: Trading behaviour mirroring sentiment

The equity put/call ratio, showing the ratio of options trading volumes by those positioning for a decline, versus an advance, in equities

Source: Bloomberg, Barclays Private Bank

One of the best ways for investors to remind themselves of the market complexity, and be better protected from its effects, is to hold a diverse portfolio of investments that spans asset classes, sectors and quality companies.

A diversified portfolio can better protect from the effects of volatility due to the correlations between asset classes. It may also insulate the investor from being caught up in the emotions induced from experiencing that volatility in the portfolio. Together, these can provide a solid foundation for protecting and growing your wealth.

Julien Lafargue, London UK, Chief Market Strategist

## Multi-asset portfolio allocation

Barclays Private Bank discusses asset allocation views within the context of a multi-asset class portfolio. Our views elsewhere in the publication are absolute and within the context of each asset class.

### Cash and short duration bonds: high conviction

- Given the significant impact of recurring waves of the COVID-19 virus globally, a preference for higher quality and liquid opportunities – which translates into our positioning in short duration bonds – is maintained
- Although real interest rates remain negative in most jurisdictions, a high conviction in the asset class seems to make sense from a risk management perspective.

### Fixed income: low conviction

Only modest opportunities are likely in fixed income given market dynamics. Although sovereign rates appear less attractive in the context of low yields, they offer protection in very weak economic environments. For this reason, a small overweight is maintained in developed market government bonds.

In credit, the higher quality segment most appeals. But as spreads have recovered remarkably from their highs during the peak of the crisis, our risk budget is allocated towards the equity space. In high yield, selection is key, and our exposure is low given the tightness of spreads. We prefer high yield, and emerging market (EM) hard currency debt, over EM local currency debt considering the risk facing their economies and currencies.

### Developed market government bonds: high conviction

- Developed market government bonds have been under pressure in recent months as investors re-price inflation and interest rate expectations for a strong economic recovery this year. We continue to see the asset class as an important diversifier however, and maintain our holding at a small overweight
- Although US dollar real rates remain at historically low levels, they are still marginally more attractive relative to the other developed market bond markets. Amid the COVID-19 outbreak and more active central bank behaviour, UK and European bonds have somewhat synchronised with US rates. However, depressed yields

make it difficult to find both markets attractive, apart from in respect of managing portfolio risk.

### Investment grade bonds: neutral

- Significant central bank intervention last year helped to offset a large contraction in the economy and allowed markets to digest a substantial increase in leverage ratios and a higher risk of downgrades
- As spreads are now back to tight levels, selection will be key
- With a potential recovery over the course of 2021 there is still room for spread compression in more cyclical sectors
- Conviction towards the asset class was reduced recently, with proceeds moved into cash.

### High yield bonds: low conviction

- Amid the market turmoil of a year ago, spreads widened to historically elevated levels before retracing
- We had previously sought to take advantage of higher spreads in high yield bonds during last year's sell-off, however the impressive recovery since means that spreads over Treasuries are close to their pre-pandemic levels and well below the long-term average
- Consequently, we have reduced our exposure to the asset class to reflect the lower returns on offer.

### Emerging market bonds: low conviction

- Emerging market hard currency debt is preferred to local currency debt considering the risk facing the respective economies and currencies
- Many EM economies run high debt deficits, low currency reserves and potentially lack capacity to deal with the COVID-19 crisis. The recovery from the pandemic differs in EM and is mostly linked to the

infection rates, with Latin America, South Africa, Israel, the Philippines and India under pressure

- However, the US Federal Reserve's dovish stance should continue to provide some relief to the largely dollar-denominated emerging market debt market
- Although corporate fundamentals are less robust and default rates are gradually rising, the majority of EM central banks have helped issuers with more accommodative monetary policies. With rising COVID-19 infections starting to affect EM economies and forex, we are more cautious on local currency debt
- Given downside risks from geopolitical issues, we maintain low conviction to the asset class as margin pressure may increase in the current volatile environment.

#### Equities: high conviction

Portfolios have been positioned in high quality, conservatively capitalised businesses for the longer term. Valuations remain elevated by historical standards but unlikely to revert back to their mean until central banks' support is dialed down. With a blue-sky scenario (from an earnings' perspective) largely priced in already, we believe investors will need to be selective.

Regionally, there seem compelling opportunities in both developed market equities and emerging market equities from a risk budgeting perspective. However, not all emerging markets are created equally and so warrant selectivity, with Asia appearing to provide a broader opportunity set than elsewhere.

- **Developed market equities: high conviction**
  - Equity markets have rallied significantly, discounting the positive news surrounding the approval of COVID-19 vaccines and a possible normalisation in the first half of 2021
  - 2021 earnings expectations seem optimistic but easy comparables should allow for a strong recovery. 2022 consensus numbers appear more challenging
  - Further out, market events have created an opportunity for those willing to take a longer term view and be selective
  - The rapid and sizeable response of central banks and governments to events means that policy should be favourable when a recovery takes hold
  - Most importantly, active management and selective stock picking of companies with strong balance sheets is favoured. We focus on businesses with high cash returns on capital, with conservative capital structures and ideally an ability to reinvest cash in future growth at equally high rates of return. The US tends to offer us more opportunities to invest in such businesses, meaning that North America remains the largest geographical weighting within the equity allocation.

#### Emerging market equities: high conviction

- Emerging markets have suffered from country specific risks and slowdown in the region, particularly after the impact of COVID-19
- While the region may suffer significantly for the pandemic in the short term (especially in Latin America), a secular shift from investment to consumption should support growth over the medium term
- Furthermore, the region should benefit from the benign rate environment
- Asia seems a more attractive prospect for growth than Latin America
- While markets appear increasingly cautious, emerging market equities should benefit from attractive valuations. Our position in the asset class was increased in January.

#### Other assets: low conviction

Alternative asset classes will continue to diversify our portfolio, but are not expected to be the main drivers of returns. Gold's record as a safe-haven asset remains attractive in the context of a diversified portfolio, and for this reason we are neutral on the asset class. Conversely, real estate and alternative trading strategies are underpinned by a weak investment case.

#### Commodities: neutral

- The sole exposure within commodities continues to be our position in gold
- Despite a weaker gold price in the past few months, value persists in gold compared to other commodities. This allocation is seen as complementary to the other risk-mitigating assets in the portfolio
- The asset class has little appeal outside of precious metals and our risk budget can be better deployed elsewhere.

#### Real estate: low conviction

- Real estate should continue to provide mild diversification benefits, helped by loose monetary policy. That said, we maintain a low conviction due to structural headwinds, such as the shift to online retailing, as well as the higher leverage in the sector.

#### Alternative trading strategies: low conviction

- The low conviction in alternatives reflects their high expense and a lack of investment opportunities. However, strategies that have low correlations to equity markets, such as merger arbitrage, appear preferable
- Nonetheless, sudden spikes in volatility, which are likely to materialise more often in a volatile environment, may lift the asset class at least in the short term.

**Investments can fall as well as rise in value. Your capital or the income generated from your investment may be at risk.**

This communication:

- (i) Has been issued by the Investments division at Barclays Private Bank (**Barclays**) and is provided for information purposes only and is subject to change. It is indicative only and not binding. References to Barclays means any entity within the Barclays Group of companies, where "**Barclays Group**" means Barclays and its affiliates, subsidiaries and undertakings.
- (ii) Is not research nor a product of the Barclays Research department. Any views expressed in this communication may differ from those of the Barclays Research department. All opinions and estimates are given as of the date of this communication and are subject to change. Barclays is not obliged to inform recipients of this communication of any change to such opinions or estimates.
- (iii) Is general in nature and does not take into account any specific investment objectives, financial situation or particular needs of any particular person.
- (iv) Does not constitute an offer, an invitation or a recommendation to enter into any product or service and does not constitute investment advice, solicitation to buy or sell securities and/or a personal recommendation. Any entry into any product or service requires Barclays' subsequent formal agreement which will be subject to internal approvals and execution of binding documents.
- (v) Is confidential and is for the benefit of the recipient. No part of it may be reproduced, distributed or transmitted without the prior written permission of Barclays.
- (vi) Has not been reviewed or approved by any regulatory authority.

Any past or simulated past performance including back-testing, modelling or scenario analysis, or future projections contained in this communication is no indication as to future performance. No representation is made as to the accuracy of the assumptions made in this communication, or completeness of, any modelling, scenario analysis or back-testing. The value of any investment may also fluctuate as a result of market changes.

Where information in this communication has been obtained from third party sources, we believe those sources to be reliable but we do not guarantee the information's accuracy and you should note that it may be incomplete or condensed.

Neither Barclays nor any of its directors, officers, employees, representatives or agents, accepts any liability whatsoever for any direct, indirect or consequential losses (in contract, tort or otherwise) arising from the use of this communication or its contents or reliance on the information contained herein, except to the extent this would be prohibited by law or regulation. Law or regulation in certain countries may restrict the manner of distribution of this communication and the availability of the products and services, and persons who come into possession of this publication are required to inform themselves of and observe such restrictions.

You have sole responsibility for the management of your tax and legal affairs including making any applicable filings and payments and complying with any applicable laws and regulations. We have not and will not provide you with tax or legal advice and recommend that you obtain independent tax and legal advice tailored to your individual circumstances.
